1: Introduction

A concise and informative introduction with literature review kept to minimum regarding the study aim. Each paper has to be built on a self-standing and precise objective which is scientifically sound with regards to the available results [1]. References are to be listed in the order in which they appear in the text and are indicated by a number in bracket as presented in this template. The text should be typeset as a single paragraph in Time New Roman, Case 12, Normal margins (2.5 cm) and line spacing 1.5.

2: material and Experimental procedure

If the section has to be divided in subsection those sections should have a concise title and raison d'être of interest. If not is recommended to build up a single paragraph section presenting the material and describing the procedure followed during the research.

3: results and discussion

Subdivision in results followed by discussion should be avoided. A single result and discussion section presenting the main results and discussions of these results should be presented. Avoid long comparison and recall from the literature [2].

4: Conclusion

A concise conclusion clearly related to the proposed objective should be given. This section should not be a copy of the short abstract accompanying these extended abstracts.
